

cgMLST usegalaxy.org Test Report

Test run: cgMLST workflow against usegalaxy.org

Date: 2026-09-16 **Command:** `scripts/run_workflow_tests.sh workflow.ga` (fetched via `scripts/fetch_iwc_workflow.py bacterial-cgmlst`) **Mode:** online / remote — `GALAXY_URL=https://usegalaxy.org` + `GALAXY_USER_KEY` (see `SETUP.md`'s "Where does the data actually go?" section — this mode uploads data and executes on usegalaxy.org's own compute, not locally) **Result:**  passed

What was tested

The real IWC workflow “**core genome Multilocus Sequence Typing (cgMLST) of Bacterial Genome**” (`workflows/bacterial_genomics/cgmlst-bacterial-genome` in the IWC registry), using its own shipped test spec (`cgmlst_bacterial_genome-tests.yml`) — not a synthetic or simplified test.

- **Input:** a real *E. coli* genome assembly FASTA (`E-coli3_S194.fasta`, from Zenodo: https://zenodo.org/records/16779020/files/E-coli3_S194.fasta)
- **Reference scheme:** `coreprofiler_downloaded_2026-01-15-escherichia_v1-cgMLST-2513-enterobase-no_token` — an Enterobase-derived *E. coli* cgMLST scheme, 2,513 loci
- **Steps executed:** `CoreProfiler allele_calling` → `ToolDistillator` → `ToolDistillator Summarize`

planemo's result

```
Invocation <c6302f905da21fcc>
Steps  ◆ 100% ◆ 5/5 scheduled
Jobs   ◆ 100% ◆ 3/3 terminal
Job States ◆ ● 3
```

```
All 1 test(s) executed passed.
workflow.ga_0: passed
```

```
tool_test_output.json summary: {"num_errors": 0, "num_failures": 0, "num_skips": 0, "num_tests": 1}.
```

All four output assertions from the workflow's own test spec passed: a specific known locus ID present in the allele-calling report, the report having exactly 2,514 columns (2,513 loci + 1 ID column), the new-alleles output being FASTA-formatted, the temporary-alleles output containing `tmp_loci`, and the aggregated JSON summary containing the expected keys.

Visual confirmation on usegalaxy.org

The same run, viewed directly in the Galaxy web UI (History → “CWL Target History”), showing all 7 datasets produced by the 3 completed jobs:

usegalaxy.org history showing the completed cgMLST workflow run

Independent confirmation via the Galaxy API

Cross-checked directly against usegalaxy.org’s API (not just planemo’s own report or the screenshot above) for the same invocation:

```
GET /api/invocations/c6302f905da21fcc
state: scheduled
steps: 5/5 scheduled (2 inputs, 3 tools)

GET /api/invocations/c6302f905da21fcc/jobs_summary
{"states": {"ok": 3}, "populated_state": "ok"}
```

Three independent sources — planemo’s exit code/report, the Galaxy web UI screenshot, and the raw Galaxy API — all agree: all 3 jobs completed with status `ok`.

What this confirms

This is the first real, end-to-end confirmation that `scripts/run_workflow_tests.sh` actually works against a live Galaxy instance — not just that the script’s CLI flags are correct (verified earlier against `planemo test --help`), but that a fetched IWC workflow runs correctly against real data and passes its own regression test. See `scripts/README.md`’s status table, updated to reflect this.
